

World Clock

A local, offline-friendly world clock and time converter inspired by the workflow of World Time Buddy, implemented from scratch for personal use.

How to use

Open [index.html](#) in a browser. No web server, package install, CDN, or internet connection is required.

Features

- Multiple time-zone rows with live seconds.
- 48-hour horizontal comparison grid.
- Hover an hour tile to compare the same instant across all locations.
- Click an hour tile to keep it selected.
- Add, remove, reorder, and set a home location.
- Add a multiline description or note of up to 100 characters for each selected time zone; each row expands automatically as notes wrap or gain line breaks.
- Search countries, standard time names, cities, and abbreviations such as [India](#), [India Standard Time](#), [IST](#), [Pakistan Standard Time](#), [PKT](#), [Australian Western Standard Time](#), [AWST](#), [Central Time \(US\)](#), [CST/CDT](#), [Central European Time](#), and [CET/CEST](#).
- Toggle 12-hour and 24-hour display.
- Toggle between light and dark themes.
- Open the ReadMe PDF from a relative [README.pdf](#) link, so it works locally and after GitHub Pages deployment.
- Sort locations by UTC offset.
- Save settings in browser local storage.
- Copy a shareable setup link using the URL hash, including selected time zones, notes, and display settings, useful after deploying the project on GitHub Pages.
- Central European Time uses the browser's IANA time-zone data ([Europe/Copenhagen](#)) so it dynamically changes between [CET](#) and [CEST](#) depending on the season.
- Shows the current year's exact CET/CEST change dates and transition time before the clock board, with the start, resume, and next-change details on separate lines.
- Improves dark-theme readability on yellow daytime and workday hour tiles.

Behavior

The app uses the browser's built-in [Intl.DateTimeFormat](#) and IANA time-zone database. That means daylight saving time and half-hour offsets are handled by the browser without downloading scripts or data files.
